Venue	SMX CONVENTION CENTER MANILA, Function Room 5
Presentation Title:	PERI IMPLANTITIS: THE MOST COMMON OF IMPLANT COMPLICATION
<p>ABSTRACT</p>	<p>The complication in dental implants can be caused in surgical stage or in maintenance phase. Peri-implantitis as one of the complication of dental implants in maintenance phase that has been reviewed in publications. Peri-implantitis is an inflammatory reaction in the tissues surrounding a load bearing implant. This condition has been increased in prevalence rate and need early treatment. The documented studies and research offer an updated overview on the etiology and risk factor of peri-implantitis such as cement retained restorations, history of periodontitis, lack of keratinized tissue, rough implant surface and immune-compromised patient. The timing of treatment has to be paid attention in managing it. Various treatments have been suggested regenerative procedure, non-surgical approaches and implant removal. The aim of this presentation is to review the current knowledge in peri-implantitis to support clinician in prevention and management.</p> <p>Keyword : peri-implantitis, etiology, risk factors, prevention.</p>
